

CASE STUDY**Bombay Hospital, Indore**

Bombay Hospital Limits Web Access and Increases Productivity with Web Filtering Feature of Seqrite Endpoint Security.

“ Seqrite has provided us with the simplest technology to block websites that we do not want our employees to access. We can now conserve our company’s bandwidth and ensure it is directed towards more productive tasks. Our systems have also been fine-tuned so they now work at optimal speed and do not face unwanted disruptions. ”

- Hemant Joshi, IT Manager, Bombay Hospital, Indore

Established in 2003, Bombay Hospital, Indore is the only NABH accredited Hospital in Madhya Pradesh. The 600-bedded super-specialty tertiary care referral centre provides one of the finest healthcare facilities with advanced infrastructure and technology. The hospital expanded its comprehensive healthcare facilities in Indore with a dedicated team of highly trained doctors and skilled nurses.

With a growing staff and a limited IT skill resource at disposal, Bombay Hospital was looking for a security solution that would be easy to deploy and use. It went for Seqrite Endpoint Security after recommendation from a trusted source and found it convenient to install and use for operational productivity. System performance went up significantly after access to unwanted websites was restricted.

Key Challenges:

- The employees had open access to social media sites and this was consuming precious bandwidth
- Use of unwanted and heavy applications resulting in frequent freezing of systems
- The hospital was finding it hard to implement a uniform policy across all systems and this led to several compliance issues.

Solutions by Seqrite:

- Web filtering to block a particular category of websites or individual user specified website
- Tuneup to clean junk files and delete invalid registry/disk entries for enhanced performance
- Group Policy Management to define user groups and assign policies to them

Business Challenge

Bombay Hospital wanted to restrict access to unwanted websites especially social networking sites. The staff had continuous access to such websites and this made the systems vulnerable to frequent malware and virus attacks, in addition to leading to a loss of business productivity. The hospital did not have any security solutions installed and was finding it difficult to protect the systems from threats. Deployment of a good security solution was a major challenge for the hospital.

Monitoring and controlling the hospital systems was becoming time consuming and the IT team was spending a lot of time finding solutions against unwanted disruptions. With its growing and comprehensive healthcare offerings, the hospital was finding it difficult to provide seamless medical services to patients as systems’ performance went down significantly.

The Seqrite Solution

Bombay Hospital did not have prior user experience with a security solution. With a limited IT support, the hospital's primary consideration was successful deployment of a security solution that would be easy to use and understand. Secondly, they wanted a solution that allowed them to block access to unwanted websites especially social networking sites. Protecting the systems against infected websites, malware and other attacks was also necessary. The IT team also needed the facility to set flexible policies for each user group and to control the kind of websites accessed by employees.

Bombay Hospital thus chose for Seqrite Endpoint Security. The solution provides easy and hassle free deployment. The Web Filtering feature allows the blocking of particular categories of websites (e.g. social networking, games, etc) or individual user specified websites to limit web access and increase productivity. The solution also has a simplified time and date specific maintenance feature called Tuneup that enhances the performance of computer systems in the network by cleaning junk files and invalid registry/disk entries. In addition, the Group Policy Management enables the client to define different user groups and set flexible policies accordingly.

Business Benefits

Web Security and Web Filtering have improved the system performance and there is less network downtime. The solution has provided enhanced security against malware and other vulnerabilities coming from insecure access to websites. The operational efficiency in the hospital has increased significantly as lesser time and resources are spent towards IT management.

Seqrite Endpoint Security

A comprehensive approach to endpoint security with host based content aware Data Loss Prevention.

Enterprise security solutions SEQRITE though relatively new in the market, is backed by a large global company Quick Heal Technologies with vast experience in many aspects of information security.

Seqrite Endpoint Security 6 consists of comprehensive endpoint security features to secure and manage endpoints. It also includes Advanced Device Control and Content Aware DLP. All of these functions are integrated into a single endpoint management console. It is compatible with a wide variety of operating environments like all flavors and versions of Windows desktops, servers, and also supports Apple Mac and Linux at endpoints. With a wide range of endpoint protection features like anti-malware, distributed firewall, content filter, asset management, application control and vulnerability scanner Seqrite Endpoint Security is a solid product for enterprise security.

Seqrite Mobile Device Management

Cloud based, centrally managed mobile management solution for enterprise environment.

Seqrite Mobile Device Management is an easy-to-use enterprise mobility solution that is cloud-based and includes all the vital security features. It simplifies the end-to-end management of Android, iOS and Windows mobile devices within your enterprise network. With Seqrite MDM you have control over the app repository and can set restrictions on the use of applications. The solution streamlines device configuration and provides complete visibility and control of all devices from a single console. Seqrite MDM offers enterprises the advantage of an economical on-demand solution.

Seqrite TERMINATOR

Single, high-performance platform for all your network security needs.

Seqrite offers the Terminator series of gateway appliances for small and midsize businesses and remote offices. The appliance provides firewall, antivirus, content and email filter, intrusion prevention and application control in a single package. This offering also includes additional features like bandwidth management, link failover management and VPN connectivity. Terminator with its excellent performance and well-designed features backed by excellent support has been winning good clients.
